Application in a henhouse in Switzerland

Andreas Morf runs a chicken farm with 4000 laying hens. He has applied penergetic t Paraprotect, which was developed to reduce mites in the henhouse.

- First application: May 5, 2017
- Second application: June 6, 2017

He says:

"I applied penergetic t Paraprotect for the first time on 5 May 2017 in the occupied barn with the hand sprayer, selectively in all places where mites accumulate. After two days I was disappointed because I could not see any effect, but after another two to five days I could see that the number of mites had decreased noticeably.

On May 23, the herd was moved out and the barn was cleaned and washed. During washing I noticed less mites than usual. I was positively surprised about the effect of penergetic t and about the very small amount I needed.

On June 6, 2017, one day before stabling in the hens again, I treated the nests with the hand sprayer.

A precise control at the beginning of October showed astonishing things: The nests were practically free of mites. Even in the aviary, which I had not treated for lack of time, only small quantities of mites could be seen in problematic places. I will do a treatment in the aviary in the next few days.

In summary: I was convinced by the product, especially by the small quantity and the long-term effect."

Consumption: 0,5 kilograms in the barn for 4000 hens.
